                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This present sequence is that of a peptide antagonist of zonulin (Z), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (T). The peptide antigonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an inflammation, where they bind to the ZOT receptor in the intestinal can yet does not physiclogically modulate the opening of TJ in the creating threstine. Gastrointestinal inflammation conditions give rise to treating intestinal permeability and the peptide is useful for caused by infection, e.g. Clostridium difficile infection, c.g. Clostridium difficile infection, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous collits, inflammatory bowel disease, diseases with graphatic obstruction, e.g. congenital intestinal lymphangiectasia, correction of congenital heart disease with Fontan's operation. Composal disease, without ulceration, e.g. congenital intestinal lymphangiectasia, coeliac disease, eosinophilic gastroenteritis, and immune disease, cell constant luous ervthematosus or food alleraiss, brimarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This present sequence is that of a peptide antagonist of zonulin (Z), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 46; 69pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Y36754-Y37949 are encoded by open reading frames (ORFS) of the genome of Chlamydia trachomatis (see 201425). The polypeptides can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigeliosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Genome sequence of Chlamydia trachomatis

This present sequence is that of a peptide antagonist of zonulin (C (2), one of 25 such peptides (see Y9105-29) of the invention, c which bind to a zonula occludens toxin (ZOT) receptor, yet do not C (T), the peptide antagonists are based on a common motif of ZOT c and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of c recombinant DNA techniques. The peptide antagonists are used as an eximinflammatory agents in the treatment of gastrointestinal cinflammation, where they bind to the ZOT receptor in the intestine castrointestinal intestine. Gastrointestinal inflammation conditions give rise to cincreased intestinal permeability and the peptide is useful for c treating intestinal conditions that cause protein losing enteropathy c enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with c classences collagenous colitis, inflammatory bowel disease, diseases marked by Imphantic obstruction, e.g. congenital intestinal lymphangiactusals, correction of congenital heart disease with Fontan's operation, collagenous colitis, inflammatory bowel disease, diseases with correction of congenital heart disease with Fontan's operation, collagenous colitis, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, collagenous colitis, mesenteric tuberculosis, and immune disease, collagense, eosinophilic gastroenteritis, and immune diseases, collagense, eosinophilic gastroenteritis, and immune diseases, collagense, primarily to milk.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  recombinant DNA techniques. The periode antagonists are used as an initinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20 receptor in the intestine cand yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to concern the intestine constitution of the zero period of the stine conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigeliests, viral gastroenteritis, parasite concern colitis, inflammatory bowel disease, diseases with concern collagenous colitis, inflammatory bowel disease, diseases with correction of congenital intestinal lymphangiectasia, correction of congenital heart disease with fontan's operation, coesiac disease, with fontan's operation, e.g. coesiac disease, eosinophilic gastroenteritis, and immune diseases, coesiac disease, eosinophilic gastroenteritis, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

The peptide antagonists are based on a common motif of ZOT human zonulins, which is believed to be critical for receptor ding. They can be prepared by chemical synthesis or by use of ombinant DNA techniques.

                                                                                                                                                                                                                                                                                                                                                                      03-SEP-1997
                                                                                                                                                                                                                                                                                                                                                                                                                                                               W09406 standard; Protein; 380 AA.
                                                                                                                                                               Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not physiologically modulate the opening of mammalian tight junctions and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or be recombinant DNA technisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New peptide antagonist of zonulin useful as antiinflammatory agent for treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 41; 69pp; English

recombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TU in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This present sequence is that of a peptide antagonist of zonuin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (ZOT) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor and human zonulins, which is believed to be critical for receptor.
                                                                                                                                     sarcoldosis lymphoma, mesencertic coverection of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, eosinophilic gastroenteritis, eosinoph

                                                                                                                                                                                                                                                                                                                 RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (207) receptor, yet do not (TJ). The peptide antagonists are based on a common motif of zon and human zonulins, which is believed to be critical for receptor of binding. They can be prepared by chemical synthesis or by use of antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 207 receptor in the intestinal conditions give rise to treatment of the combinate of astrointestinal inflammation conditions give rise to treatment of the combined of the intestinal conditions of the caused by infection, e.g. Clostridium difficile infection, the caused by infection, e.g. Clostridium difficile infection, bacterial overgrowth, whipple's disease with concerning conditions, shigellosis, viral gastroenteritis, parasite collagenous colitis, inflammatory bowel disease, diseases with collagenous colitis, inflammatory bowel disease, diseases with concerning correction of congenital heart disease with Fontan's operation, collagenous without ulceration, e.g. Menetrier's disease, costanghalic gastroenteritis, and immune diseases, costanghalic gastroenteritis, and immune diseases.

Guanylin is an intestinal guanylate cyclase regulate which has similarity to bacterial heat stable enterotoxins which activate intestinal guanylate cyclases. The guanylin peptide can be used as a laxative in the treatment of constipation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a human guanylin preprohormone which is cleaved to generate a 15 amino acid mature peptide (Y42458). This sequence is the encoded protein from a composite DNA sequence isolated by probing a human duodenum cDNA library with the corresponding rat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI; 1999-590442/50

```
This sequence represents a human guanylin preprohormone which is cleaved to generate a 15 amino acid mature peptide (Y42458). Guanylin is an intestinal guanylate cyclase regulator which has similarity to bacterial heat stable enterotoxins which activate intestinal guanylate cyclases. The guanylate can be used as a laxative in the treatment of constraints.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0;

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin for portion (e.g. x84924) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 125 novel genes and their fragments (nucleic acid sequences: x84933-x85057; amino acid sequences y27567-Y27933) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polypucleotides, based or which tissues they are most highly expressed in (see x84933 for described
             New isolated human cytomegalovirus nucleic acid - from Towne and Toledo strains, used to develop prods. for the diagnosis, preven and treatment of human CMV infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

    This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not physiologically modulate the opening of mammalian tight junctions (TJ). The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of antiinflammatory agents in the treatment of gastrointestinal
                                                                                                                                                                                  New peptide antagonist of zonulin useful as antiinflammatory agent treating cerebral ischemia, stroke, cerebral edema, gastritis, shigellosis, viral gastroenteritis, meningitis, encephalomyelitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to contreased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, conference infestation, bacterial overgrowth, whipple's disease, diseases with concertain controls, e.g. gastrifits, parasite mucosal erosion or ulcerations, e.g. systricts, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by carcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Frontan's operation, correction of congenital heart disease with Frontan's operation, collicated disease, without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, comities, systemic lupus erythematosus or food allergies, primarily to milk.

```

The amino acid sequence is that of the zonula occludens toxin (ZOT). It may be responsible for diarrhoea in some strains of cholera and the ZOT gene or fragments of it are deleted from strains of Vibrio cholerae (V.c.) to be used as vaccines. These V.c. strains have 100% efficacy in protecting humans against subsequent infection with a strain of a similar serotype and avoid undesirable side effects such as diarrhoea, nausea and cramping. Cultures of these strains may be

used for prodn.

       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score

J. BIOL. Chem. 271:2271-2278(1996).

-I- CATALYTIC ACTIVITY: HYDROLYSIS OF PROTEIN AND PEPTIDE SUBSTRATES PREFERENTIALLY ON CARBOXYL SIDE OF HYDROPHOBIC RESIDUES.
-I- COFACTOR: BINDS ONE ZINC ION.
-I- SUBUNIT: HETEROTETRAMER OF TWO ALPHA AND TWO BETA SUBUNITS WHICH IS FORMED BY THE NON-COVALENT ASSOCIATION OF TWO DISULFIDE-LINKER HETERODIMERS.
                                                                                                                                                                                                                                                                                MEPB_MOUSE

REQUIRES THAT THE GLYCOSYLATED ASPARAGINE-LINKED GLYCOPROTEINS. REQUIRES THAT THE GLYCOSYLATED ASPARAGINE MOIETY IS NOT SUBSTITUTED ON ITS AMINO (R1) AND TARBOXYL (R2) TERMINUS.

TO ATALYTIC ACTIVITY: N4-GBETA-N-ACETYL-D-GLUCOSAMINYL)-L-ASPARAGINE + H(2)0- N-ACETYL-BETA-GLUCOSAMINYLAMINE + L-ASPARTATE.

SUBGULT: HETERODIMER OF AN ALPHA AND A BETA CHAINS.
SUBCELLULAR LOCATION: PERIPLASMIC.
